**Fiber-reinforced Polymer (FRP) Reinforcement for Concrete Structures**, 2005      *Modular FRP Composite Blast Wall System Test and Analysis* Ross Brayton Cussen, 2004      **Evaluation of Post-tension Strengthened Steel Girder Bridge Using FRP Bars** Terry J. Wipf, 2003

Many state county and local agencies are faced with deteriorating bridge infrastructure composed of a large percentage of relatively short to medium span bridges. In many cases these older structures are rolled or welded longitudinal steel stringers acting compositely with a reinforced concrete deck. Most of these bridges although still in service need some level of strengthening due to increases in legal live loads or loss of capacity due to deterioration. Although these bridges are overstressed in most instances they do not warrant replacement thus structurally efficient but cost effective means of strengthening needs to be employed. In the past the use of bolted steel cover plates or angles was a common retrofit option for strengthening such bridges. However the time and labor involved to attach such a strengthening system can sometimes be prohibitive. This project was funded through the Federal Highway Administration's Innovative Bridge Research and Construction program. The goal is to retrofit an existing structurally deficient three span continuous steel stringer bridge using an innovative technique that involves the application of post tensioning forces. The post tensioning forces were applied using fiber reinforced polymer post tensioning bars. When compared to other strengthening methods the use of carbon fiber reinforced polymer composite materials is very appealing in that they are highly resistant to corrosion, have a low weight and have a high tensile strength. Before the post tensioning system was installed a diagnostic load test was conducted on the subject bridge to establish a baseline behavior of the unstrengthened bridge. During the process of installing the post tensioning hardware and stressing the system both the bridge and the post tensioning system were monitored. The installation of the hardware was followed by a follow up diagnostic load test to assess the effectiveness of the post tensioning strengthening system. Additional load tests were performed over a period of two years to identify any changes in the strengthening system with time. Laboratory testing of several typical carbon fiber reinforced polymer bar specimens was also conducted to more thoroughly understand their behavior. This report documents the design, installation and field testing of the strengthening system and bridge.

**Advanced Polymer Composites for Structural Applications in Construction** L C Hollaway, 2004-04-22

Over the past three decades advanced polymer composites have emerged as an attractive construction material for new structures and the strengthening/rehabilitation of existing buildings and bridges. The techniques associated with the technology analysis and design of polymer composites in construction are continually being researched and the progress made with this exciting material will continue at an ever increasing rate to meet the demands of the construction industry. This volume of proceedings is from the Second ACIC 2004 International Conference which focused on the application and further exploitation of advanced composites in construction. The conference allowed practising engineers, asset managers, researchers and representative of regulatory bodies to promote the active exchange of scientific

and technical information on the rapidly changing scene of advanced composites in construction This volume focuses on the presentation of new concepts techniques and case studies which will lead to greater exploitation of advanced polymer composites and FRP materials for civil engineering infrastructure rehabilitation and renewal Presents new concepts techniques and case studies *Ludwig's Applied Process Design for Chemical and Petrochemical Plants* A. in popularity over the past few years As such many design codes and guidelines have been developed to enable designers to use the FRP materials with confidence in their performance In this work FRP durability test results are used with a widely known degradation prediction model to determine the value of FRP material properties used in rehabilitation and strengthening of concrete over time Equations are presented based on the test data to predict the tensile strength tensile modulus short beam shear strength and flexural strength over time of FRP prefabricated strips from three manufacturers Corresponding degradation data is presented for the adhesive recommended by each manufacturer for use The degradation model is used on example girders used in previous research by Atadero and Karbhari 1996 for illustration of differences in the codes and guidelines design property values and those possessed by FRP materials over time to demonstrate the use of the time based reliability factor within the LRFD model presented in an earlier report to Caltrans A reliability analysis is conducted in each example case to compare the results A proposed shift in design philosophy is presented to enable inclusion of material degradation over time and thereby make concrete rehabilitation with FRP strips more efficient and cost effective
