Frp Reinforced Concrete Shear Abaqus:

FRPRCS-5 C. J. Burgoyne, 2001 Fibre reinforced plastics are increasingly being used as replacements for steel reinforcement in concrete structures The reinforcement can be untensioned or it can be in the form of prestressing tendons It is also suitable for gluing onto the outside of a structure to improve flexural or shear performance This book provides up to date research results to give engineers confidence in their design methods Fiber-reinforced Polymer (FRP) Reinforcement for Concrete Structures, 2005

Advances in Engineering Materials, Structures and Systems: Innovations, Mechanics and Applications Alphose Zingoni, 2019-08-21 Advances in Engineering Materials Structures and Systems Innovations Mechanics and Applications comprises 411 papers that were presented at SEMC 2019 the Seventh International Conference on Structural Engineering Mechanics and Computation held in Cape Town South Africa from 2 to 4 September 2019 The subject matter reflects the broad scope of SEMC conferences and covers a wide variety of engineering materials both traditional and innovative and many types of structures The many topics featured in these Proceedings can be classified into six broad categories that deal with i the mechanics of materials and fluids elasticity plasticity flow through porous media fluid dynamics fracture fatigue damage delamination corrosion bond creep shrinkage etc ii the mechanics of structures and systems structural dynamics vibration seismic response soil structure interaction fluid structure interaction response to blast and impact response to fire structural stability buckling collapse behaviour iii the numerical modelling and experimental testing of materials and structures numerical methods simulation techniques multi scale modelling computational modelling laboratory testing field testing experimental measurements iv innovations and special structures nanostructures adaptive structures smart structures composite structures bio inspired structures shell structures membranes space structures lightweight structures long span structures tall buildings wind turbines etc v design in traditional engineering materials steel concrete steel concrete composite aluminium masonry timber glass vi the process of structural engineering conceptualisation planning analysis design optimization construction assembly manufacture testing maintenance monitoring assessment repair strengthening retrofitting decommissioning The SEMC 2019 Proceedings will be of interest to civil structural mechanical marine and aerospace engineers Researchers developers practitioners and academics in these disciplines will find them useful Two versions of the papers are available Short versions intended to be concise but self contained summaries of the full papers are in this printed book The full versions of the papers are in the e book Finite Element Modelling of FRP Reinforced Concrete Beams and Comparative Analysis of Current Strength Prediction Methods Ryan Barrage, 2017 The modelling of glass fibre reinforced polymer GFRP reinforced concrete beams was conducted by the author in the finite element analysis software ABAQUS The study extended upon the work done by Joseph Stoner 2015 to calibrate the Concrete Damaged Plasticity CDP model with the intent to ultimately complement laboratory testing in a research setting Furthermore current strength prediction methods for beams reinforced with fibre reinforced polymer FRP

were evaluated against a database of tested beams collected from literature. The validity of the proposed ABAQUS models was assessed against selected beams from the database. Finally a parametric study was conducted on 12 GFRP reinforced beams over 12 slenderness ratios to study the effects of slenderness. The database of tested beams consisted of beams that failed in shear as tests on slender beams reinforced with FRP are scarce. The strength prediction models were therefore evaluated on their ability to predict shear capacity. The models included in the analysis are the CSA S806 12, the ACI440 1R 15, the Japan Society of Civil Engineers JSCE and the Intelligent Sensing for Innovative Structures ISIS Canada Manual No 3 shear models as well as a prediction model proposed by Nehdi et al 2007. The study concluded that the Nehdi model most accurately predicts the shear capacity for beams with transverse reinforcement, with the remainder of the models providing very conservative values. For beams without shear reinforcement, all models provided good estimates for the shear capacity, with the CSA S806 12 model matching most closely to experimental data. The ABAQUS models proposed by Stoner were evaluated against a series of 8 beams taken from literature: two beams without shear reinforcement and six with shear reinforcement. The results validated the recommendations made by Stoner and verified the use of 30% dilation concrete to model beams without stirrups and 50% dilation concrete to model beams with stirrups. Further research was deemed necessary to accurately model beams that exhibited both flexural crushing and stirrup rupture. The results of the parametric study suggested that the beams without shear reinforcement required large shear span to depth ratios to fail in flexure, exceeding ratios of 15. The beams with shear reinforcement failed in flexure at slenderness ratios approaching 10, demonstrating the increased shear strength provided by the stirrups. The increase in slenderness ratio required to fail in flexure compared to steel reinforced beams is attributed to the larger tensile strength of GFRP bars. Furthermore, an investigation into the shear capacity prediction methods of CSA S806 12 yielded that the model under predicts the stirrup contribution to shear capacity. Further investigation determined the most likely cause was the modelling of the confinement induced by the stirrups.
