Hepner, Erika Litvin Bloom, Sydne Newberry, Jessica L. Sousa, Karen Chan Osilla, Marika Booth, Armenda Bialas, Carolyn M. Rutter, 2022-05-10 This report presents results from a systematic review and meta analyses of research examining how mindfulness meditation affects 13 performance related outcomes of interest to the U S Army and broader military The authors supplemented the systematic review by examining how mindfulness meditation could support stress management and exploring characteristics of selected mindfulness programs

Mindfulness Meditation for Chronic Pain Margaret Maglione, 2016 RAND researchers conducted a systematic review that synthesized evidence from randomized controlled trials of mindfulness meditation interventions used adjunctively or as monotherapy to provide estimates of their efficacy and safety in alleviating chronic pain in adults Outcomes of interest included changes in pain symptomatology use of analgesics functional status health related quality of life functional impairment disability measures and adverse events Meta analyses for efficacy outcomes were conducted using the Hartung Knapp Sidik Jonkman method for random effects models Quality of evidence was assessed using the Grades of Recommendation Assessment Development and Evaluation or GRADE approach In total 28 studies met inclusion criteria Mindfulness meditation was associated with a small effect of improved pain symptoms compared with control groups in a meta analysis of 24 randomized controlled trials However there was evidence of substantial heterogeneity among studies resulting in a low quality of evidence assessment for this outcome We were unable to determine which patient subgroups or intervention characteristics were associated with greater efficacy Mindfulness meditation statistically significantly improved depression and health related quality of life Adverse events were rare and not serious but the vast majority of studies did not collect adverse event data The low quality of evidence prevents any strong conclusions about mindfulness meditation for

chronic pain Additional trials with adequate power greater efforts to prevent attrition monitoring of adherence to meditation practice active collection of adverse events and better reporting of methods are suggested Publisher's description

A Review of the Effects of Mindfulness Meditation on Chronic Pain in Older Adults Gregory H. Jacks, 2023 Pain is a biopsychosocial phenomenon which draws from physiological responses as well as cultural and social context and mental states Pain is most frequently treated through surgical and pharmacological interventions which can be costly and time consuming especially when treating chronic pain Older adults suffer from chronic pain at a higher rate than the rest of the population and more accessible interventions are

desperately needed to help manage the experience of chronic pain Mindfulness meditation is increasingly being utilized for management of pain due to evidence of its effectiveness cheaper cost and ability to be practiced outside of medical facilities Prior research studies looked at the effectiveness of using mindfulness meditation to manage chronic pain but a limited number have focused on older adults This systematic review was conducted to examine the benefits of mindful meditation in managing chronic pain in older adults Eight studies were included and narrative synthesis was used to demonstrate that while mindful meditation does not appear to reduce pain intensity it may help manage chronic pain in older adults by changing the relationship to pain which in turn may reduce functional impairment and negative emotions and improve quality of life Clinical applications are discussed

Biopsychosocial Factors of Stress, and Mindfulness for Stress Reduction Holly Hazlett-Stevens, 2022-02-14 This volume brings together basic research on the nature of stress reactivity with up to date research on the effectiveness and mechanisms of mindfulness interventions The chapters review the major research areas that elucidate the impact of stress reactivity on health and explore the mechanisms and effectiveness of mindfulness based approaches for stress reduction and improved physical and emotional health The first section examines biopsychosocial mechanisms of stress reactivity such as allostasis and allostatic load neurobiology of stress biology of the fight or flight and tend and befriend responses and psychoneuroimmunology This section concludes by addressing the roles of perception and

appraisal including the role of perceived threat in stress reactivity as well as the role that negative perceptions of the stress response itself play in compromising health. The second section opens with review of leading psychological models of mindfulness including self regulation re-perceiving and the Intention Attention Attitude IAA triaxiomatic model. Subsequent chapters discuss mindfulness based interventions and mechanisms of change for stress and related clinical conditions including chronic pain traumatic stress anxiety and related disorders and clinical depression. The final chapter reviews possible neural networks and brain mechanisms associated with mindfulness meditation practice. As the research on stress reactivity and mindfulness based stress reduction continues to proliferate this book offers readers a single volume covering the most relevant information across this vast terrain. Other available volumes offer in depth coverage of stress research with little mention of mindfulness and stress reduction. Conversely many texts on the topic of mindfulness and mindfulness based interventions do not adequately cover the biopsychosocial processes of stress reactivity.

Mindfulness Meditation for the Treatment of Tobacco Use Margaret Maglione, 2017. RAND researchers conducted a systematic review that synthesized evidence from randomized controlled trials of mindfulness meditation interventions used adjunctively or as monotherapy to provide estimates of their efficacy and safety for treating tobacco use. The primary outcome of interest was smoking tobacco cessation. Other outcomes of interest included reduction in use decrease in cravings health related quality of life and adverse events. Meta analyses for efficacy outcomes were conducted using the Hartung Knapp Sidik Jonkman method for random effects models. Quality of evidence was assessed using the Grades of Recommendation Assessment Development and Evaluation or GRADE approach. Nine studies met inclusion criteria. Studies compared mindfulness training for smokers mindfulness training and a mindfulness based smoking cessation program with American Lung Association's Freedom from Smoking program quitline counseling interactive learning or treatment as usual. Intervention duration and intensity varied considerably. Meta analyses for smoking cessation and cigarettes smoked per day indicated no statistically significant differences between mindfulness interventions and comparator interventions. Analysis suggested effects vary by type of intervention. Only three studies reported on adverse events; they stated that there were no reportable medication reactions associated with the adjunctive nicotine replacement treatment or that no serious adverse events occurred. We conclude that the body of evidence for mindfulness meditation for the treatment of tobacco use is very limited. Additional high quality studies with samples large enough to detect effects and confirming smoking cessation through biochemical means are suggested. Publisher's description.
